

Final Project Report

Digital Gold Diggers

By Estrella Moreira, Dawa Lama, Zhi Li, Ali Salem

[Declaration: The finding and ideas inside this project are only for educational and learning purpose, all findings and strategies are not for real life trading!!]

1. Introduction

Large-cap cryptocurrencies are generally considered to be safe crypto investments, these are companies with a market cap of more than \$10 billion. The hypothesis of this project is that the prior view of crypto assets being decorrelated with traditional assets is no longer true; While this may be true for small and mid-cap cryptos, large-cap cryptos are now being used by large institutional investors as a hedge on other assets. Yet, they are currently still view as "risk on" assets, this means that they have a significant correlation with high-risk equities. The goal of this project is to use macro-indicator assets such as precious metals, stock indexes, interest rates and forex rates to anticipate crypto movements. With this in mind, we aim to trade large-cap cryptocurrencies based on traditional finance and macro indicators.

1.1 Market Universe

- Instruments

For our universe, we choose five of the top large-cap cryptos. The instruments, along with their approximate market caps as of May 2022 are as follows:

- Bitcoin (BTC) - \$563B
- Ethereum (ETH) - \$239B
- Binance Coin (BNB) - \$53B
- USD_Coin (USDC-USD) - \$53B
- Cardano (ADA) - \$17B

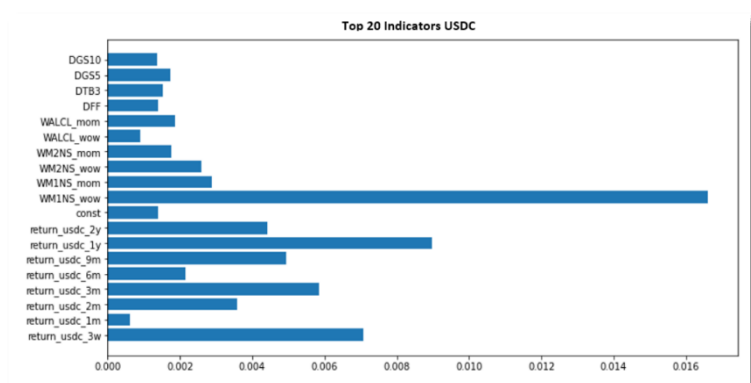

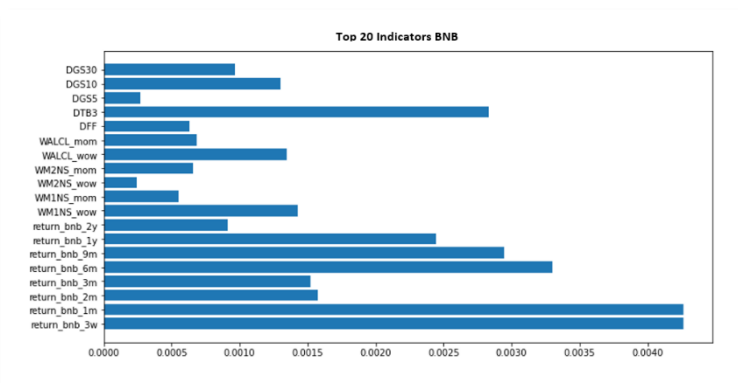

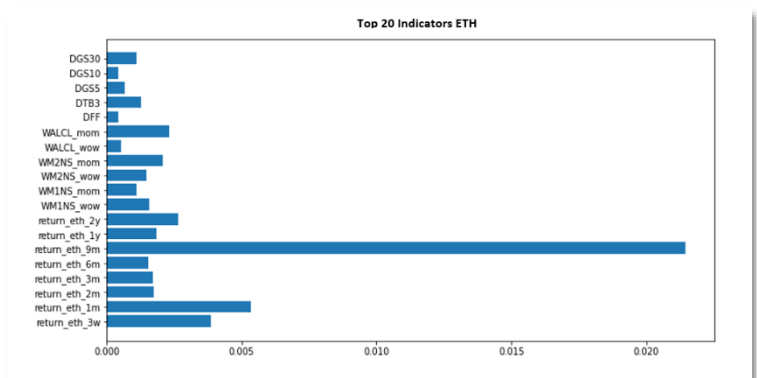

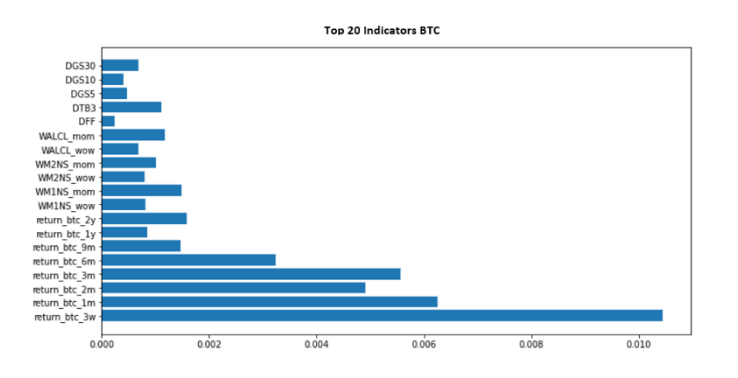

- Datasets

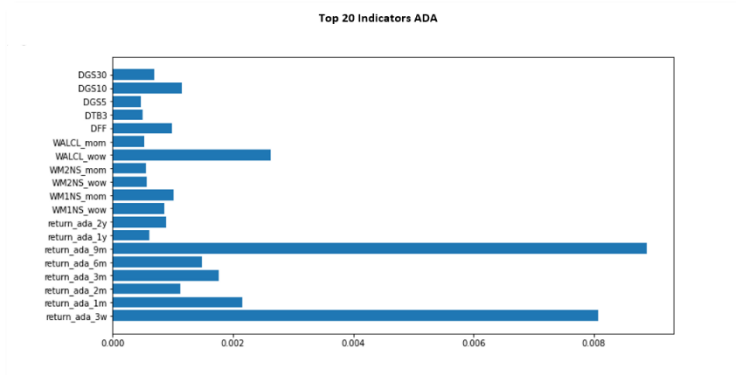

The datasets used for this project and the market caps values are from:

- <https://www.yahoo.com>
- <https://coinmarketcap.com>
- <https://fred.stlouisfed.org>

- Macro Indicators

For our macro-indicators we used the top 20 Indicators having a direct effect on each cryptocurrency from Fred and Yahoo Finance

1.2 Feature Engineering

We used feature engineering to prepare all the macro-indicators and add additional features such as momentum, historical returns and calculate the factor betas.

- Cryptocurrency Returns - these were the lags we used to calculate returns (10 lags that capture short and long term past returns)
- Factor Betas - we calculated the factor betas for each stock to include them as features for our machine learning model
- Momentum - Traders and investors have long known about the effects of momentum and have found that these effects appear across a wide variety of markets and time frames. we added momentum factors to run these strategies on every single currency

1.3 Modeling

1. We used the Random Forest model which took all of the different factors and features to try to predict the next two weeks of return
2. We calculated the feature importance by extracting the most important variables (indicators) affecting each of the crypto currencies
3. We applied our model to test data in order to test the returns

- BTC Performance

- ETH Performance

- BNB Performance

- USDC Performance

- **ADA Performance**

As a result, all of our model were capable of predicting the evolution of the target

1.4 Generating Alpha Signals

The Alpha signal is the net forward-looking estimate of an asset's future potential relative to other securities in a coverage universe. We used the Alpha input signals generated by our model as the numerator for the Mean Variance Optimization (MVO) for the predictions of each of the crypto currencies.

- **BTC**

- **ETH**

- **BNB**

- **USDC**

- ADA

1.5 Strategy Definition

From the Alpha signals generated by the AI, we added SELL, BUY and HOLD signals. In this case, if the predicted returns are positive, we decide to buy and if the predicted returns are negative, we decide to sell. For trading and transaction cost purposes, we decided to use the Binance Cryptocurrency Exchange as all the cryptocurrencies we are using are available there and transaction costs is 0.1%.

- **BTC Strategy and Portfolio Evaluation**

Strategy - adding sell, buy and hold signal from the alpha generated by the AI, including Transaction cost

1.6 Strategy Annualized Return

Running our machine learning model on each of the coins with each of the factors considered above, we were able to predict annualized return for each cryptocurrency.

- **BTC**

- **ETH**

- **BNB**

- **USDC**

- ADA

1.7 Conclusion

Large-cap cryptocurrencies are generally considered to be safe crypto investments. We were able to trade large-cap cryptocurrencies based on traditional finance and macro-indicators with the help of the different signals (SELL, BUY and HOLD) from the Alpha signal generated by the AI. The Cryptocurrencies used were: ADA, BNB, BTC, USDB and ETH. We can conclude that our model was capable of predicting the evolution of each one of these cryptocurrencies against multiple macro-indicators and provide significant returns over time.
